

## BUSINESS OWNER'S CHECKLIST: IT SECURITY & SUCCESS

## A secure, cost-effective IT plan is 10 steps away

Do you have a verified current list of all admin logins and passwords? Without these you do not have control over your environment and are beholden to your provider. What if they go out of business or have a rouge employee?

**Do you have a disaster recovery plan documented?** You should be testing monthly, have the ability to restore data and know how quickly you can make it happen.

**Do you have a business continuity plan documented?** You need a process in place so when a disaster hits everyone knows exactly what to do, even if you're not around. Downtime = loss of revenue

Do you have an inventory of all hardware and software for upgrade planning? Not having upgrades planned 3-4 years out means you have to use capital resources that you may or not may not have or risk the loss of efficiency and growth.

**Does your provider meet with you monthly or quarterly?** In todays business things change rapidly. Your provider should be in tune with your business goals and be a part of helping you align your technology to help meet and exceed those goals.

Have you had a third party do a network evaluation? A simple contract and invoice review could save you thousands monthly. (We recently reviewed a client's invoice and they were spending \$60.00 per user per month too much for Managed IT!)

Have you had a security network scan or penetration test Hackers and bad guys are counting on you not ensuring your network is secure and protected, having a once a year test ensures your environment is safe and sound.

Do you have anyone doing third party IT oversight? Having a fractional CIO/CTO means you have experts in your corner ensuring you get great products and services for the right price, along with guidance on new technologies.

Is your provider meeting the agreed upon service terms? Don't settle thinking the devil you have is better than the one you may get. Always make sure you're getting the right service and support.

**Does your provider deliver monthly status and analysis reports?** Having a running history of your support requirements, and how the provider is meeting those is critical in measuring and holding them accountable to their Service Level Agreements (SLAs).
